

Group discussions: groups of 4

1. Compare the output of the moisture index with the land uses – does the pattern follow the land uses?
 - a) Hint – look at some other imagery e.g. Google Earth
2. What land uses seem to be most strongly affecting the soil moisture index?
3. Find some areas where the results look good and make sense to you + write some notes on the LU trend and the land use – maybe take a screen shot?
4. Are there some areas that look strange or unexpected?
 - a) Please write some notes on what LU and why it looks strange
5. Do you have any other suggestions for analyses or other data to help interpreting the results? *E.g. rainfall data ...or: BRG site: prims.brg.go.id/platform*
6. Any other comments welcome...
